Tuto Installation TMC2208Pilot Arduino

Download then install Atom https://atom.io/

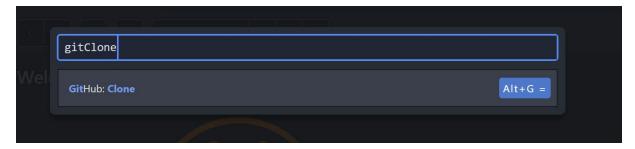

Go to Atom Settings then package and install the packages:

- Platformio-ide
- Gitplus

Once the packages above install do SHIFT+CTRL+P

The window below opens entry "gitclone" then entered

Go to the Github TMC2208Pilot and copy the link using the button below

Go back to Atom and paste the link in the window below, then click on

The Github and cloned !! It now appears in the column Project

Unroll src and go to conf.h started setting up your TMC2208

[SUCCESS] Took 51.30 seconds

Nota:

The NodeMCU must be started after your printer so it is advisable to feed it by 5v pin and Gnd Available on your motherboard

Once your Arduino booted went to the top bar at PlatformelO / Serial Monitor:

In the terminal you can enter the commands getConf / getMon / startMon / StopMon

- getConf = View the configuration
- getMon = View the values (monitoring) of the Drivers
 (First make a startMon)
- startMon = Start monitoring the values of the drivers
- stopMon = Stop the monitoring of the values of the Drivers

You can also configure a Switch (Smoothieware only) with ERROR PIN and CHECK PIN in order to not be able to start or pause if the arduino detects a driver configuration error the piece of code is available in the section WIKI
